

ABSTRACT

A system for maintaining a WAP portal/ site including different interrelated pages so as to be able to provide a requested page to a requesting terminal (19) appropriate to the terminal type (i.e. so that it can be displayed or otherwise utilized by the terminal type). The system includes: a site structure database (11) containing the WAP (or XHTML) site structure and metadata; a site management application (SMA) (12) for maintaining the site; a set of templates (14) for respective pages and for different terminal types; a content data store (16) for the different pages, possibly differing for different terminal types; and a content delivery application (CDA) (15) for providing a page requested by a terminal (19) with the page tailored to the terminal type.
